Feedback from the peer review from *Maryam Barouti, Xiaoni Cao, Sanjevv Sandeep*:

- The project topic is interesting.
- Since there are so many years, the circles representing years in the year chart might be jammed. So it would be difficult to select a specific year.
  - Suggestion: two arrow keys/buttons can be added to the year chart. By clicking one button, the year moves backward one, and forward one by clicking the other.
  - Our answer: we planned to add a slide bar to the year chart.
  - Our thoughts: this concern is reasonable and adding arrow keys/buttons is a good idea. We will probably add it too.
- Line chart is not necessary because having the map and the parallel coordinate is already enough for our project.
  - Our answer: we are not sure about that. We are happy to add line charts since they can show things the map and the parallel coordinates can not show.
  - Our thoughts: this suggestion is not that helpful.

Feedback from *Carolina*:

- Some countries might be too small to be selected from the map.
  - Suggestion: a search bar can be added and users can type a country name to pick the country.
  - Our thoughts: it is a good idea. We plan to add the search bar to the world map.
- If a small country has a very big value of a certain attribute, it might be difficult to spot it on a normal world map.
  - Suggestion: use another world map projection so that a country's size is proportional to its value of the attribute.
  - Our thoughts: another good idea! We would love to have this implemented if time permits.
- The story telling component is missing.
  - Suggestion: extract something interesting from our own interaction with the tool and include that as the story telling component.
  - Our thoughts: we will keep this in mind and hopefully come up with some good stories.
